stratum as such. Transitions, of course, are fluid but precisely the largest settlement at times embracing hundreds of thousands even millions of inhabitants displays this very phenomenon. In medieval Byzantine Constantinople the representatives of urban districts were leaders of party divisions who financed circus races (as is still the case for the horse race of Siena). The Nika revolt under Justinian was a product of such local cleavages of the city. Also in Constantinople, from the time of the Islamic Middle Ages until the sixteenth century, only merchants, corporations, and guilds appear as representatives of the interests of the burghers beside purely military associations such as the Janitscharen and Sipahis and the religious organizations of the Ulemas and Dervishes. However, in sixteenth century Constantinople there is still no city representation. Similarly in late Byzantine Alexandria, beside the power of the patricians, relying upon the support of very sturdy monks, and the competitive power of the governor relying on a small garrison there was no militia for particular city districts. Within the districts of the city only the circus parties of rival “greens” and “blues” represented the leading organizations.

THE METROPOLIS AND MENTAL LIFE
Georg Simmel

The deepest problems of modern life derive from the claim of the individual to preserve the autonomy and individuality of his existence in the face of overwhelming social forces, of historical heritage, of external culture, and of the technique of life. The fight with nature which primitive man has to wage for his bodily existence attains in this modern form its latest transformation. The eighteenth century called upon man to free himself of all the historical bonds in the state and in religion, in morals and in economics. Man’s nature, originally good and common to all, should develop unhampered. In addition to more liberty, the nineteenth century demanded the functional specialization of man and his work; this specialization makes one individual incomparable to another, and each of them indispensable to the highest possible extent. However, this specialization makes each man the more directly dependent upon the supplementary activities of all others. Nietzsche sees the full development of the individual conditioned by the most ruthless struggle of individuals; socialism believes in the suppression of all competition for the same reason. Be that as it may, in all these positions the same basic motive is at work: the person resists to being leveled down and worn out by a social technological mechanism. An inquiry into the inner meaning of specifically modern life and its products, into the soul of the cultural body, so to speak, must seek to solve the equation which structures like the metropolis set up between the individual and the super-individual contents of life. Such an inquiry must answer the question of how the personality accommodates itself in the adjustments to external forces. This will be my task today.

Translated by H. H. Gerth with the assistance of C. Wright Mills. Reprinted with permission of The Macmillan Company from The Sociology of Georg Simmel edited by Kurt Wolff. Copyright 1950 by The Free Press.
The psychological basis of the metropolitan type of individuality consists in the intensification of nervous stimulation which results from the swift and uninterrupted change of outer and inner stimuli. Man is a differentiating creature. His mind is stimulated by the difference between a momentary impression and the one which preceded it. Lasting impressions, impressions which differ only slightly from one another, impressions which take a regular and habitual course and show regular and habitual contrasts—all these use up, so to speak, less consciousness than does the rapid crowding of changing images, the sharp discontinuity in the grasp of a single glance, and the unexpectedness of onrushing impressions. These are the psychological conditions which the metropolis creates. With each crossing of the street, with the tempo and multiplicity of economic, occupational, and social life, the city sets up a deep contrast with small town and rural life with reference to the sensory foundations of psychic life. The metropolis exacts from man as a discriminating creature a different amount of consciousness than does rural life. Here the rhythm of life and sensory mental imagery flows more slowly, more habitually, and more evenly. Precisely in this connection the sophisticated character of metropolitan psychic life becomes understandable—as over against small town life which rests more upon deeply felt and emotional relationships. These latter are rooted in the more unconscious layers of the psyche and grow most readily in the steady rhythm of uninterrupted habituations. The intellect, however, has its locus in the transparent, conscious, higher layers of the psyche; it is the most adaptable of our inner forces. In order to accommodate to change and to the contrast of phenomena, the intellect does not require any shocks and inner upheavals; it is only through such upheavals that the more conservative mind could accommodate to the metropolitan rhythm of events. Thus the metropolitan type of man—which, of course, exists in a thousand individual variants—develops an organ protecting him against the threatening currents and discrepancies of his external environment which would uproot him. He reacts with his head instead of his heart. In this an increased awareness assumes the psychic prerogative. Metropolitan life, thus, underlies a heightened awareness and a predominance of intelligence in metropolitan man. The reaction to metropolitan phenomena is shifted to that organ which is least sensitive and quite remote from the depth of the personality. Intellectuality is thus seen to preserve subjective life against the overwhelming power of metropolitan life, and intellectuality branches out in many directions and is integrated with numerous discrete phenomena.

The metropolis has always been the seat of the money economy. Here the multiplicity and concentration of economic exchange gives an importance to the means of exchange which the scantiness of rural commerce would not have allowed. Money economy and the dominance of the intellect are intrinsically connected. They share a matter-of-fact attitude in dealing with men and with things; and, in this attitude, a formal justice is often coupled with an inconsiderate hardness. The intellectually sophisticated person is indifferent to all genuine individuality, because relationships and reactions result from it which cannot be exhausted with logical operations. In the same manner, the individuality of phenomena is not commensurate with the pecuniary principle. Money is concerned only with what is common to all: it asks for the exchange value, it reduces all quality and individuality to the question: How much? All intimate emotional relations between persons are founded in their individuality, whereas in rational relations man is reckoned with like a number, like an element which is in itself indifferent. Only the objective measurable achievement is of interest. Thus metropolitan man reckons with his merchants and customers, his domestic servants and often even with persons with whom he is obliged to have social intercourse. These features of intellectuality contrast with the nature of the small circle in which the inevitable knowledge of individuality as inevitably produces a warmer tone of behavior, a behavior which is beyond a mere objective balancing of service and return. In the sphere of the economic psychology of the small group it is of importance that under primitive conditions production serves the customer who orders the good, so that the producer and the consumer are acquainted. The modern metropolis, however, is supplied almost entirely by production for the market, that is, for entirely unknown purchasers who never personally enter the producer's actual field of vision. Through this anonymity the interests of each party acquire an unmerciful matter-of-factness; and the intellectually calculating economic egoisms of both parties need not fear any deflection because of the imponderables of personal relationships. The money economy dominates the metropolis; it has displaced the last survivals of domestic production and the direct barter of goods; it minimizes, from day to day, the amount of work ordered by customers. The matter-of-fact attitude is obviously so intimately interrelated with the money economy, which is dominant in
the metropolis, that nobody can say whether the intellectualistic mentality first promoted the money economy or whether the latter determined the former. The metropolitan way of life is certainly the most fertile soil for this reciprocity, a point which I shall document merely by citing the dictum of the most eminent English constitutional historian: through the whole course of English history, London has never acted as England’s heart but often as England’s intellect and always as her moneybag.

In certain seemingly insignificant traits, which lie upon the surface of life, the same psychic currents characteristically unite. Modern mind has become more and more calculating. The calculative exactness of practical life which the money economy has brought about corresponds to the ideal of natural science: to transform the world into an arithmatically calculable life which the money economy has brought about corresponds. Only money economy has filled the days of so many people with weighing, calculating, with numerical determinations, with a reduction of qualitative values to quantitative ones. Through the calculative nature of money a new precision, a certainty in the definition of identities and differences, an unambiguousness in agreements and arrangements has been brought about in the relations of life-elements—just as externally this precision has been effected by the universal diffusion of pocket watches. However, the conditions of metropolitan life are at once cause and effect of this trait. The relationships and affairs of the typical metropolitan usually are so varied and complex that without the strictest punctuality in promises and services the whole structure would break down into an inextricable chaos. Above all, this necessity is brought about by the aggregation of so many people with such differentiated interests, who must integrate their relations and activities into a highly complex organism. If all clocks and watches in Berlin would suddenly go wrong in different ways, even if only by one hour, all economic life and communication of the city would be disrupted for a long time. In addition an apparently mere external factor: long distances, would make all waiting and broken appointments result in an ill-afforded waste of time. Thus, the technique of metropolitan life is unimaginable without the most punctual integration of all activities and mutual relations into a stable and impersonal time schedule. Here again the general conclusions of this entire task of reflection become obvious, namely, that from each point on the surface alone—one may drop a sounding into the depth of the psyche so that all the most banal external-
joined by another source which flows from the money economy. The essence of the blasé attitude consists in the blunting of discrimination. This does not mean that the objects are not perceived, as is the case with the half-wit, but rather that the meaning and differing values of things, and thereby the things themselves, are experienced as insubstantial. They appear to the blasé person in an evenly flat and gray tone; no one object deserves preference over any other. This mood is the faithful subjective reflection of the completely internalized money economy. By being the equivalent to all the manifold things in one and the same way, money becomes the most frightful leveler. For money expresses all qualitative differences of things in terms of "how much?" Money, with all its colorlessness and indifference, becomes the common denominator of all values; irreparably it hollows out the core of things, their individuality, their specific value, and their incomparability. All things float with equal specific gravity in the constantly moving stream of money. All things lie on the same level and differ from one another only in the size of the area which they cover. In the individual case this coloration, or rather discoloration, of things through their money equivalence may be unnoticeably minute. However, through the relations of the rich to the objects to be had for money, perhaps even through the total character which the mentality of the contemporary public everywhere imparts to these objects, the exclusively pecuniary evaluation of objects has become quite considerable. The large cities, the main seats of the money exchange, bring the purchasability of things to the fore much more impressively than do smaller localities. That is why cities are also the genuine locale of the blasé attitude. In the blasé attitude the concentration of men and things stimulates the nervous system of the individual to its highest achievement so that it attains its peak. Through the mere quantitative intensification of the same conditioning factors this achievement is transformed into its opposite and appears in the peculiar adjustment of the blasé attitude. In this phenomenon the nerves find in the refusal to react to their stimulation the last possibility of accommodating to the contents and forms of metropolitan life. The self-preservation of certain personalities is brought at the price of devaluing the whole objective world, a devaluation which in the end unavoidably drags one's own personality down into a feeling of the same worthlessness.

Whereas the subject of this form of existence has to come to terms with it entirely for himself, his self-preservation in the face of the large city demands from him a no less negative behavior of a social nature.
metropolis goes back to one of the large developmental tendencies of social life as such, to one of the few tendencies for which an approximately universal formula can be discovered. The earliest phase of social formations found in historical as well as in contemporary social structures is this: a relatively small circle firmly closed against neighboring, strange, or in some way antagonistic circles. However, this circle is closely coherent and allows its individual members only a narrow field for the development of unique qualities and free, self-responsible movements. Political and kinship groups, parties and religious associations begin in this way. The self-preservation of very young associations requires the establishment of strict boundaries and a centripetal unity. Therefore they cannot allow the individual freedom and unique inner and outer development. From this stage social development proceeds at once in two different, yet corresponding, directions. To the extent to which the group grows—numerically, spatially, in significance and in content of life—to the same degree the group’s direct, inner unity loosens, and the rigidity of the original demarcation against others is softened through mutual relations and connections. At the same time, the individual gains freedom of movement, far beyond the first jealous delimitation. The individual also gains a specific individuality to which the division of labor in the enlarged group gives both occasion and necessity. The state and Christianity, guilds and political parties, and innumerable other groups have developed according to this formula, however much, of course, the special conditions and forces of the respective groups have modified the general scheme. This scheme seems to me distinctly recognizable also in the evolution of individuality within urban life. The small-town life in Antiquity and in the Middle Ages set barriers against movement and relations of the individual toward the outside, and it set up barriers against individual independence and differentiation within the individual self. These barriers were such that under them modern man could not have breathed. Even today a metropolitan man who is placed in a small town feels a restriction similar, at least, in kind. The smaller the circle which forms our milieu is, and the more restricted those relations to others are which dissolve the boundaries of the individual, the more anxiously the circle guards the achievements, the conduct of life, and the outlook of the individual, and the more readily a quantitative and qualitative specialization would break up the framework of the whole little circle.

The ancient polis in this respect seems to have had the very character of a small town. The constant threat to its existence at the hands of enemies from near and afar effected strict coherence in political and military respects, a supervision of the citizen by the citizen, a jealousy of the whole against the individual whose particular life was suppressed to such a degree that he could compensate only by acting as a despot in his own household. The tremendous agitation and excitement, the unique colorfulness of Athenian life, can perhaps be understood in terms of the fact that a people of incomparably individualized personalities struggled against the constant inner and outer pressure of a de-individualizing small town. This produced a tense atmosphere in which the weaker individuals were suppressed and those of stronger natures were incited to prove themselves in the most passionate manner. This is precisely why it was that there blossomed in Athens what must be called, without defining it exactly, “the general human character” in the intellectual development of our species. For we maintain factual as well as historical validity for the following connection: the most extensive and the most general contents and forms of life are most intimately connected with the most individual ones. They have a preparatory stage in common, that is, they find their enemy in narrow formations and groupings the maintenance of which places both of them into a state of defense against expance and generality lying without and the freely moving individuality within. Just as in the feudal age, the “free” man was the one who stood under the law of the land, that is, under the law of the largest social orbit, and the unfree man was the one who derived his right merely from the narrow circle of a feudal association and was excluded from the larger social orbit—so today metropolitan man is “free” in a spiritualized and refined sense, in contrast to the pettiness and prejudices which hem in the small-town man. For the reciprocal reserve and indifference and the intellectual life conditions of large circles are never felt more strongly by the individual in their impact upon his independence than in the thickest crowd of the big city. This is because the bodily proximity and narrowness of space makes the mental distance only the more visible. It is obviously only the reverse of this freedom if, under certain circumstances, one nowhere feels as lonely and lost as in the metropolitan crowd. For here as elsewhere it is by no means necessary that the freedom of man be reflected in his emotional life as comfort.

It is not only the immediate size of the area and the number of persons which, because of the universal historical correlation between the enlargement of the circle and the personal inner and outer freedom,
The German School

has made the metropolis the locale of freedom. It is rather in transcending this visible expanse that any given city becomes the seat of cosmopolitanism. The horizon of the city expands in a manner comparable to the way in which wealth develops; a certain amount of property increases in a quasi-automatic way in ever more rapid progression. As soon as a certain limit has been passed, the economic, personal, and intellectual relations of the citizenry, the sphere of intellectual predominance of the city over its hinterland, grow as in geometrical progression.

Every gain in dynamic extension becomes a step, not for an equal, but for a new and larger extension. From every thread spinning out of the city, ever new threads grow as if by themselves, just as within the city the unearned increment of ground rent, through the mere increase in communication, brings the owner automatically increasing profits. At this point, the quantitative aspect of life is transformed directly into qualitative traits of character. The sphere of life of the small town is, in the main, self-contained and autarchic. For it is the decisive nature of the metropolis that its inner life overflows by waves into a far-flung national or international area. Weimar is not an example to the contrary, since its significance was hinged upon individual personalities and died with them; whereas the metropolis is indeed characterized by its essential independence even from the most eminent individual personalities. This is the counterpart to the independence, and it is the price the individual pays for the independence, which he enjoys in the metropolis. The most significant characteristic of the metropolis is this functional extension beyond its physical boundaries. And this efficacy reacts in turn and gives weight, importance, and responsibility to metropolitan life. Man does not end with the limits of his body or the area comprising his immediate activity. Rather is the range or, person constituted by the sum of effects emanating from him temporally and spatially. In the same way, a city consists of its total effects which extend beyond its immediate confines. Only this range is the city’s actual extent in which its existence is expressed. This fact makes it obvious that individual freedom, the logical and historical complement of such extension, is not to be understood only in the negative sense of mere freedom of mobility and elimination of prejudices and petty philistinism. The essential point is that the particularity and incomparability, which ultimately every human being possesses, be somehow expressed in the working-out of a way of life. That we follow the laws of our own nature—and this after all is freedom—becomes obvious and convincing to our-
themselves some modicum of self-esteem and the sense of filling a position is indirect, through the awareness of others. In the same sense a seemingly insignificant factor is operating, the cumulative effects of which are, however, still noticeable. I refer to the brevity and scarcity of the inter-human contacts granted to the metropolitan man, as compared with social intercourse in the small town. The temptation to appear “to the point,” to appear concentrated and strikingly characteristic, lies much closer to the individual in brief metropolitan contacts than in an atmosphere in which frequent and prolonged association assures the personality of an unambiguous image of himself in the eyes of the other.

The most profound reason, however, why the metropolis conduces to the urge for the most individual personal existence—no matter whether justified and successful—appears to me to be the following: the development of modern culture is characterized by the preponderance of what one may call the “objective spirit” over the “subjective spirit.” This is to say, in language as well as in law, in the technique of production as well as in art, in science as well as in the objects of the domestic environment, there is embodied a sum of spirit. The individual in his intellectual development follows the growth of this spirit very imperfectly and at an ever increasing distance. If, for instance, we view the immense culture which for the last hundred years has been embodied in things and in knowledge, in institutions and in comforts, and if we compare all this with the cultural progress of the individual during the same period—at least in high status groups—a frightful disproportion in growth between the two becomes evident. Indeed, at some points we notice a retrogression in the culture of the individual with reference to spirituality, delicacy, and idealism. This discrepancy results essentially from the growing division of labor. For the division of labor demands from the individual an ever more one-sided accomplishment, and the greatest advance in a one-sided pursuit only to a frequently means dearth to the personality of the individual. In any case, he can cope less and less with the overgrowth of objective culture. The individual is reduced to a negligible quantity, perhaps less in his consciousness in his practice and in the totality of his obscure emotional states that are derived from this practice. The individual has become a mere cog in an enormous organization of things and powers which tear from his hands all progress, spirituality, and value in order to transform them from their subjective from into the form of a purely objective life. It needs merely to be pointed out that the metropolis is the genuine arena of this culture which outgrows all personal life. Here in buildings and educational institutions, in the wonders and comforts of space-conquering technology, in the formations of community life, and in the visible institutions of the state, is offered such an overwhelming fullness of crystallized and impersonalized spirit that the personality, so to speak, cannot maintain itself under its impact. On the one hand, life is made infinitely easy for the personality in that stimulations, interests, uses of time and consciousness are offered to it from all sides. They carry the person as if in a stream, and one needs hardly to swim for oneself. On the other hand, however, life is composed more and more of these impersonal contents and offerings which tend to displace the genuine personal colorations and incomparabilities. This results in the individual’s summoning the utmost in uniqueness and particularization, in order to preserve his most personal core. He has to exaggerate this personal element in order to remain audible even to himself. The atrophy of individual culture through the hypertrophy of objective culture is one reason for the bitter hatred which the preachers of the most extreme individualism, above all Nietzsche, harbor against the metropolis. But it is, indeed, also a reason why these preachers are so passionately loved in the metropolis and why they appear to the metropolitan man as the prophets and saviors of his most unsatisfied yearnings.

If one asks for the historical position of these two forms of individualism which are nourished by the quantitative relation of the metropolis, namely, individual independence and the elaboration of individuality itself, then the metropolis assumes an entirely new rank order in the history of the spirit. The eighteenth century found the individual in oppressive bonds which had become meaningless—bonds of a political, agrarian, guild, and religious character. They were restraints which, so to speak, forced upon man an unnatural form and outmoded, unjust inequalities. In this situation the cry for liberty and equality arose, the belief in the individual’s full freedom of movement in all social and intellectual relationships. Freedom would at once permit the noble substance common to all to come to the fore, a substance which nature had deposited in every man and which society and history had only deformed. Besides this eighteenth-century ideal of liberalism, in the nineteenth century, through Goethe and Romanticism, on the one hand, and through the economic division of labor, on the other hand, another ideal arose: individuals liberated from historical bonds now wished to dis-
The German School

tinguish themselves from one another. The carrier of man’s values is no
longer the “general human being” in every individual, but rather man’s
qualitative uniqueness and irreplaceability. The external and internal
history of our time takes its course within the struggle and in the chang-
ing entanglements of these two ways of defining the individual’s role in
the whole of society. It is the function of the metropolis to provide the
area for this struggle and its reconciliation. For the metropolis presents
the peculiar conditions which are revealed to us as the opportunities and
the stimuli for the development of both these ways of allocating roles
to men. Therewith these conditions gain a unique place, pregnant with
inestimable meanings for the development of psychic existence. The
metropolis reveals itself as one of those great historical formations in
which opposing streams which enclose life unfold, as well as join one
another with equal right. However, in this process the currents of life,
whether their individual phenomena touch us sympathetically or anti-
pathetically, entirely transcend the sphere for which the judge’s attitude
is appropriate. Since such forces of life have grown into the roots and
into the crown of the whole of the historical life in which we, in our
fleeting existence, as a cell, belong only as a part, it is not our task
either to accuse or to pardon, but only to understand.*

*The content of this lecture by its very nature does not derive from a cita-
able literature. Argument and elaboration of its major cultural-historical ideas
are contained in my Philosophie des Geldes (The Philosophy of Money; Mün-
chen und Leipzig: Duncker und Humblot, 1900).

THE SOUL OF THE CITY
Oswald Spengler

About the middle of the second millennium before Christ, two worlds
lay over against one another on the Aegean Sea. The one, darkly grop-
ing, big with hopes, drowsy with the intoxication of deeds and sufferings,
ripening quietly towards its future, was the Mycenaean. The other, gay
and satisfied, snugly ensconced in the treasures of an ancient Culture,
elegant, light, with all its great problems far behind it, was the Minoan
of Crete.

We shall never really comprehend this phenomenon, which in these
days is becoming the center of research-interest, unless we appreciate
the abyss of opposition that separates the two souls. The man of those
days must have felt it deeply, but hardly “cognized” it. I see it before
me: the humility of the inhabitant of Tiryns and Mycenae before the
unattainable esprit of life in Cnossus, the contempt of the well-bred of
Cnossus for the petty chiefs and their followers, and withal a secret
feeling of superiority in the healthy barbarians, like that of the German
soldier in the presence of the elderly Roman dignitary.

How are we in a position to know this? There are several such mo-
mements in which the men of two Cultures have looked into one another’s
eyes. We know more than one “Inter-Culture” in which some of the most
significant tendencies of the human soul have disclosed themselves.

As it was (we may confidently say) between Cnossus and My-
cenae, so it was between the Byzantine court and the German chief-
tains who, like Otto II, married into it—undisguised wonder on the
part of the knights and counts, answered by the contemptuous astonish-
